YOUR WORKFORCE HAS CHANGED, HAS YOUR ORGANIZATION KEPT UP?

A wide-ranging workshift is happening right now, creating extensive opportunities for organizations to significantly reduce operating costs, improve employee effectiveness, and advance environmental awareness and efficiency. The People & Places Measurement System provides your organization with the tools to

measure and manage the financial, environmental and societal impacts of the daily work choices of your workforce.

The People & Places Measurement System records individual choices regarding employee work locations and commute patterns.

The comprehensive software as a service solution quantifies and redefines how organizations report on financial and environmental impacts associated with the operation of company and employee-owned vehicles and objectively assesses the effectiveness of sustainable workplace programs (e.g., telework, flex work, workforce mobilization).

KEY CUSTOMER BENEFITS

Transparency and Auditability –

Provides an objective and auditable snapshot of the previously hidden bi-products of employees' daily work choices – giving organizations a more comprehensive accounting of the financial and environmental footprint associated with business operations.

Individual Awareness and Feedback –

Gives employees the ability to control their individual 3BL impacts driving sustainable change from the ground up. Users can adjust their personal “report card” to assess their relative impacts compared to a variety of other user groups and scenarios, look at cumulative or actual impacts, and specify the reporting period they are most interested in.

Ease of Use – Simplified workflow makes set-up and configuration a breeze and engaging interfaces enhance user participation.

Flexible / Scalable / Cost Effective

– the “per employee” subscription based model allows a company to match their investment with the pace of program roll-out – lowering a significant barrier to entry. No need for costly system integration or on-site operations / management.

KEY FEATURES

The System provides valuable data to measure the positive impact intelligent work practices have on: Greenhouse Gas (GHG) emissions and other environmental pollutants; congestion and transportation infrastructure; employee productivity and engagement; and financial

savings. The wide-ranging reports delineate the triple bottom line impacts for participating individuals, organizations and communities where they live and work. These reports can be configured to include:

1. Environmental impacts such as greenhouse gas (GHGs), particulates, and other gas emissions
2. Employee time savings such as reduced commuting times, and foregone out-of-town travel
3. Dollar savings for employees such as fuel, vehicle maintenance, parking and other expenses triggered by commuting or work related travel
4. Dollar savings for organizations such as real estate, employee benefits, reduced sick days, and employee turnover
5. The aggregate triple bottom benefits can be bundled and included in your organization's Corporate Social Responsibility Report and support other enterprise sustainability or emissions abatement efforts
